WEEK 1

.Env

```
### 3. How do you use it in real life?
You are likely using AI every day without realising it:

 * "Netflix or YouTube recommendations" – The computer "learns" what you like based on what you've
   watched before, and then suggests something new that fits your taste.
 * "Voice assistants (like Siri or Alexa)" – They can talk to you, understand your voice, figure out what
   you are asking, and choose the best way to answer.
 * "Spam filters" – Your email provider uses AI to look at millions of emails. It learns what "spam"
   looks like, so it can automatically move those emails to your Spam folder before you even see them.

### In short:
"AI is a computer system designed to perform tasks that usually require human intelligence, like
recognizing faces, translating languages, solving problems, or learning from experience."

It isn't "alive" or "conscious"--it's just a very advanced tool that has become incredibly good at
solving patterns in data.
